Thick Visible Gold Intersection in the First RC Drill-hole at Justinian

Eleckra Mines Limited ("Eleckra") (ASX: EKM) reports that panning of RC drill chips from the first hole at Justinian has found visible gold in numerous intervals. The Company has commenced a maiden RC drilling program over the 500 metre long **Justinian Trend** (previously called Central Bore East), located approximately 200 metres east of the high grade Central Bore discovery.

First RC hole 10EYRC0107 drilled at Justinian Trend was inclined 60° to the local grid east.

Abundant visible very fine gold and fine sulphides were panned from the entire 7-metre wide zone from a depth of 68 - 75 metres. Gold mineralisation was associated with strong alteration and with elevated **molybdenum**.

The first batch of assay results from this program will be reported as they become available.

Executive Chairman Ian Murray commented: "We are delighted with the results of the first RC hole at the Justinian Trend. This trend has all the characteristics of the Central Bore Discovery including visible gold in the pan and the association with elevated molybdenum. We believe we have a cluster of high grade gold shoots in this region and the significant width of this intersection suggests the Justinian Trend could be even more significant than Central Bore. "

About Eleckra Mines Limited

Eleckra Mines Limited (ASX: EKM) is a gold exploration company which owns tenements covering over 4,000 kilometres² of the Yamarna greenstone belt. The Yamarna belt, adjacent to the 500 kilometre long Yamarna shear zone, is a historically under-explored region that is highly prospective for gold mineralisation and hosts a number of significant new discoveries. It lies north of the recently discovered 6 million ounce AngloGold-Ashanti / Independence's Tropicana deposit.

Eleckra is focussing on progressing its two key project areas within the greater Yamarna Project:

- The **Attila Trend**, which includes Attila, Alaric and Khan deposits and extends for over 33 kilometres and hosts a significant JORC mineral resource.
- The **Central Bore Trend** is a 6 km² area east of the southern extent of the Barbarian Trend which has delivered four new discoveries in 15 months:
 - **Central Bore** - gold mineralisation over a strike length of 800 metres and from surface to a depth of 300 metres, with assay results of up to 404g/t gold. It remains open to the north, south and depth.
 - **Justinian** – 200 metres east of Central Bore, 600 metres long, wider structure than Central Bore.
 - **Byzantium** – 500 metres west of Central Bore, 1km long, VMS style base metal prospect.
 - **Hann** – 2.4km west of Central Bore, 2.8km long, three parallel gold anomalies.

NOTES:

The information in this report which relates to Exploration Results, or Mineral Resources is based on information compiled by Ziggy Lubieniecki, the General Manager of Eleckra Mines Limited, who is a Member of the Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists. Ziggy Lubieniecki has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the 2004 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Ziggy Lubieniecki consents to the inclusion in the report of the matters based on this information in the form and context in which it appears.
